

The heatmap displays the probability of a black stone being captured at each intersection on a 19x19 Go board. The color scale ranges from dark purple (low probability) to bright yellow (high probability). The highest capture probabilities are concentrated in the top-right corner, specifically in the 13th to 19th columns and 1st to 5th rows. The probability decreases as the stone is placed further from this high-risk area, with the lowest probabilities (dark purple) found in the bottom-left corner and along the left edge of the board.
