

The heatmap visualizes the probability of a black stone being captured at each intersection on a 19x19 Go board. The color scale indicates the probability, with dark blue representing low probability and red representing high probability. The highest capture probabilities are concentrated in the center of the board (around the 10-12 lines) and along the third and fourth lines from the edges. The corners and the outermost lines (1 and 18) show the lowest capture probabilities.
